

IFS 244 Tutorial Exercise Fri 28 Aug 2026

1. Write a PLSQL script in SQL Developer using the HR database, that will extract the first name, last name, job title, minimum salary, and maximum salary for an employee whose ID is 105. Your script must declare variables to hold each datum, by using the %TYPE syntax, and then assign the values from the database in an anonymous block below the declarations, using a single query, finally printing all the values on a single line in the DBMS Output window. The salary values must be prefixed with R for Rand and suffixed with .00.
